* Utilise une technologie électromagnétique à haute intensité, qui a la capacité d'induire des contractions musculaires supramaximales.

*Le champ magnétique à changement rapide induit des ondes électriques dans les tissus où il polarise les membranes neurales et régit les unités motrices dans le tissu musculaire cible, provoquant des contractions concentriques.

*Pendant le traitement, les muscles sont contractés à des niveaux

supramaximaux. Les contractions supramaximales intensives améliorent la libération d'épinéphrine, ce qui déclenche un effet en cascade conduisant à une lipolyse supramaximale dans les cellules graisseuses.

*Pendant ce temps, répond par un profond remodelage de sa structure interne, induit la croissance des myofibrilles (hypertrophie musculaire), la création de nouveaux brins protéiques et la croissance des fibres musculaires (hyperplasie musculaire). Le processus entraîne une augmentation de la densité et du volume musculaire.

PRINCIPLE

HOW IT WORKS

EMSCULPT with HIFEM technology induces supramaximal muscle contractions not achievable by voluntary actionWhen exposed to supramaximal contractions, the muscle tissue is forced to adapt to such extreme condition.

The musle responds with a deep remodeling of its inner structure, i.e, the growth of myofibr ils (muscle hypertrophy)and creation of new protein strands and muscle fibers (muscle hyperplasia).
