Work Theory

It concentrated thermal heating of the vaginal tissue inner layers induces collagen and elastin contraction and regeneration of these proteins in the longer term. These molecular signals activate the entire wound healing process of the body's local immune system. The treatment outcome is the complete remodeling of the vaginal tissue in addition to re-establishment of firm "young like" vaginal tissue embedded with string-like, thick and long collagen fibers.

1. Laser irradiation angle can be adjusted

2. Laser irradiation can be rotated 360 degrees

WORKING PRINCIPLE

The CO₂ laser uses a unique hand piece which tracks the CO₂ 10.6 μ m wavelength light as it passes light through its optical lens to penetrate the skin. We can control the depth of the penetration from only a few micrometers in depth (only as deep as a few sheets of paper) to much deeper with tiny thermal channels. This will also determine the length of healing, the number of treatments and the cost. Each thermal channel creates a small micro-injury but does not significantly disturb or disrupt the surrounding tissue.
